# Natural Language Processing with Deep Learning

Lecture 11 – Text generation 4: Decoder-only models and GPT

Prof. Dr. Ivan Habernal

December 22, 2023

Natural Language Processing Group Paderborn University We focus on Trustworthy Human Language Technologies

www.trusthlt.org

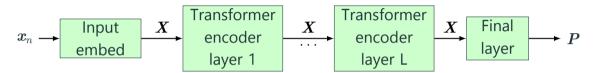

#### **Motivation**

We introduced BERT, a powerful transformer model for learning contextualized token embeddings

#### BERT can be used for

- text classification (one sequence, two concatenated sequences)
- sequence labeling (classify each token, e.g., NER, POS)

#### **Transformer encoder (BERT)**

For each input token, BERT produces contextualized word embeddings

#### **Motivation**

Although BERT is pre-trained with masked-language modeling, it is **not designed to generate text** by predicting the next token

Why?

#### **Motivation**

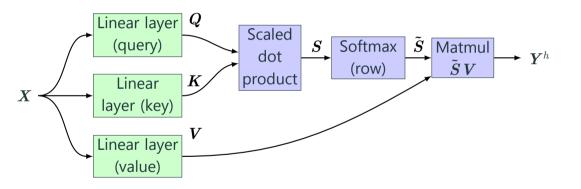

Although BERT is pre-trained with masked-language modeling, it is **not designed to generate text** by predicting the next token

Why?

We mask random tokens from the sequence and perform self-attention over past and future tokens

Can we use a transformer as a 'true' language model, aka. to conditionally generate text?

#### **Recap: Single unmasked self-attention head (BERT)**

### Recap: Bidirectional / unmasked self-attention

Input:  $X \in \mathbb{R}^{\ell_{\mathsf{X}} \times d_{\mathsf{X}}}$ , vector representations of the sequence of length  $\ell_{\mathsf{X}}$ Output:  $\tilde{V} \in \mathbb{R}^{\ell_{\mathsf{X}} \times d_{\mathsf{out}}}$ , updated vector representations of tokens in XParams  $W_{akv}$ :  $W_a$ ,  $W_k \in \mathbb{R}^{d_{\mathsf{X}} \times d_{\mathsf{attn}}}$ ,  $b_a$ ,  $b_k \in \mathbb{R}^{d_{\mathsf{attn}}}$ ,  $W_v \in \mathbb{R}^{d_{\mathsf{X}} \times d_{\mathsf{out}}}$ ,  $b_v \in \mathbb{R}^{d_{\mathsf{out}}}$ 

- 1: **function** Attention( $X; \mathcal{W}_{akv}$ )
- $Q \leftarrow XW_a +_{(\text{rows})} b_a$
- 3:  $K \leftarrow XW_k +_{\text{(rows)}} b_k$
- 4:  $V \leftarrow XW_{ij} +_{(rows)} b_{ij}$
- $S \leftarrow rac{1}{\sqrt{d_{ ext{attra}}}}(oldsymbol{Q}oldsymbol{K}^ op)$ 5:
- return  $V = \operatorname{softmax}_{row}(S) V$ 6:

- $\triangleright \mathsf{Query} \in \mathbb{R}^{\ell_{\mathsf{X}} \times d_{\mathsf{attn}}}$ 
  - $riangleright \mathsf{Kev} \in \mathbb{R}^{\ell_{\mathsf{X}} imes d_{\mathsf{attn}}}$
- $\triangleright$  Value  $\in \mathbb{R}^{\ell_{\mathsf{X}} \times d_{\mathsf{out}}}$
- $\triangleright$  Scaled score  $\in \mathbb{R}^{\ell_x \times \ell_x}$

#### Recap: Basic single-query attention

Input:  $e \in \mathbb{R}^{d_{\mathsf{in}}}$ , vector representation of the current token

Input:  $e_t \in \mathbb{R}^{d_{\text{in}}}$ , vector representations of the context tokens  $t \in [T]$ 

Output:  $\tilde{v} \in \mathbb{R}^{d_{\text{out}}}$ , vector representation of the token and context combined

Params:  $W_a$ ,  $W_k \in \mathbb{R}^{d_{\mathsf{in}} \times d_{\mathsf{attn}}}$ ,  $b_a$ ,  $b_k \in \mathbb{R}^{d_{\mathsf{attn}}}$ ,  $W_v \in \mathbb{R}^{d_{\mathsf{in}} \times d_{\mathsf{out}}}$ ,  $b_v \in \mathbb{R}^{d_{\mathsf{out}}}$ 

- 1: **function** Basic single-query attention
- $q \leftarrow e \, W_a + b_a$

- for  $t \in [T]$  do 3:
- 4:  $k_t \leftarrow e_t W_b + b_b$

⊳ Key linear projection

 $\alpha_t = \frac{\exp(q \cdot k_t / \sqrt{d_{\text{attn}}})}{\sum_{t=1}^T \exp(q \cdot k_t / \sqrt{d_{\text{attn}}})}$  > Softmax over scaled dot products,  $\alpha_t \in (0,1)$ 5.  $v_t \leftarrow e_t W_u + b_u$ 6:

return  $\tilde{\boldsymbol{v}} = \sum_{t=1}^{T} \alpha_t \boldsymbol{v}_t$ 7:

# **Example: Basic single-query unmasked attention**

We are at position 2, our query  $\mathbf{q} = (11, 12)$  and keys  $\mathbf{k_1} = (1, 2)$   $\mathbf{k_2} = (4, 5)$   $\mathbf{k_3} = (7, 8)$   $\mathbf{q} = \begin{pmatrix} 11 & 12 \end{pmatrix} \quad \mathbf{K}^{\top} = \begin{pmatrix} 1 & 4 & 7 \\ 2 & 5 & 8 \end{pmatrix}$ 

$$\mathbf{q} \cdot \mathbf{k_1} = (11, 12) \cdot (1, 2) = 11 + 24 = 35$$
  
 $\mathbf{q} \cdot \mathbf{k_2} = (11, 12) \cdot (4, 5) = 44 + 60 = 104$   
 $\mathbf{q} \cdot \mathbf{k_3} = (11, 12) \cdot (7, 8) = 77 + 96 = 173$ 

Raw scores = (35, 104, 173), after softmax (no scaling)  $\alpha = (0.000..., 0.000..., 0.999...)$ 

Value at pos 3 most weight (from the future)

Prof. Dr. Ivan Habernal | 7

## We want to attend only to previous tokens

For 4 tokens:

At position 1 we should not attend to token 2, 3, and 4

At position 2 we should not attend to token 2 and 3

At position 3 we should not attend to token 4

At position 4 we can attend to all of them

Raw associations = 
$$\begin{pmatrix} 11 & 12 & 13 & 14 \\ 21 & 22 & 23 & 24 \\ 31 & 32 & 33 & 34 \\ 41 & 42 & 43 & 44 \end{pmatrix}$$

We want to assign zero probability (using softmax) to "future" tokens

### We want to attend only to previous tokens

Raw associations = 
$$\begin{pmatrix} 11 & 12 & 13 & 14 \\ 21 & 22 & 23 & 24 \\ 31 & 32 & 33 & 34 \\ 41 & 42 & 43 & 44 \end{pmatrix}$$

Assign zero probability (using softmax) to "future" tokens

- 1: for  $t \in [T]$  do
- 3:  $\alpha_t = \frac{\exp(q \cdot k_t)}{\sum_{u=1}^t \exp(q \cdot k_u)}$ 4: **for**  $i \in (t+1, T)$  **do**
- 5:  $\alpha_i = 0$
- 7: **return**  $\tilde{\boldsymbol{v}} = \sum_{t=1}^T \alpha_t \boldsymbol{v}_t$

 $\triangleright$  Only until t

Prof. Dr. Ivan Habernal

#### **Avoid for-loops!**

For each row s from the raw associations

- 1:  $\alpha_t = \frac{\exp(s_t)}{\sum_{u=1}^t \exp(s_u)}$
- 2: for  $i \in (t+1, T)$  do
- 3:  $\alpha_i = 0$

How to vectorize this operation?

#### **Avoid for-loops!**

For each row s from the raw associations

- 1:  $\alpha_t = \frac{\exp(s_t)}{\sum_{u=1}^t \exp(s_u)}$ 2: **for**  $i \in (t+1,T)$  **do**
- 3:  $\alpha_i = 0$

How to vectorize this operation?

Replace input from t+1 onwards with  $-\infty$ 

Raw associations "masked" = 
$$\begin{pmatrix} 11 & -\infty & -\infty & -\infty \\ 21 & 22 & -\infty & -\infty \\ 31 & 32 & 33 & -\infty \\ 41 & 42 & 43 & 44 \end{pmatrix}$$

Assigns zero probability (using softmax) to "future" tokens

### **Uni-directional masking for self-attention**

For  $t_z, t_x \in [\ell_x]$ 

$$\max[t_x, t_z] = \begin{cases} 1 & \text{if } t_z \le t_x \\ 0 & \text{otherwise} \end{cases}$$

Example for  $\ell_x = 4$ 

$$\begin{pmatrix} 1 & 0 & 0 & 0 \\ 1 & 1 & 0 & 0 \\ 1 & 1 & 1 & 0 \\ 1 & 1 & 1 & 1 \end{pmatrix}$$

Creating the mask and indexing tensor by this mask very easy in pytorch

### **Left-to-right masked self-attention**

Input:  $X \in \mathbb{R}^{\ell_{\mathsf{X}} \times d_{\mathsf{X}}}$ , vector representations of the sequence of length  $\ell_{\mathsf{X}}$ Output:  $\tilde{V} \in \mathbb{R}^{\ell_{\mathsf{X}} \times d_{\mathsf{out}}}$ , updated vector representations of tokens in XParams  $W_{akv}$ :  $W_a$ ,  $W_k \in \mathbb{R}^{d_{\mathsf{X}} \times d_{\mathsf{attn}}}$ ,  $b_a$ ,  $b_k \in \mathbb{R}^{d_{\mathsf{attn}}}$ ,  $W_v \in \mathbb{R}^{d_{\mathsf{X}} \times d_{\mathsf{out}}}$ ,  $b_v \in \mathbb{R}^{d_{\mathsf{out}}}$ 

```
1: function Attention(X; \mathcal{W}_{akv})
```

2: 
$$oldsymbol{Q} \leftarrow oldsymbol{X} oldsymbol{W}_q +_{ ext{(rows)}} oldsymbol{b}_q$$

$$q + (rows) \theta_q$$

$$m{K} \leftarrow m{X}m{W}_k +_{(\mathsf{rows})} m{b}_k$$

4: 
$$oldsymbol{V} \leftarrow oldsymbol{X} oldsymbol{W}_v +_{(\mathsf{rows})} oldsymbol{b_v}$$

5: 
$$S \leftarrow \frac{1}{\sqrt{dw}}(QK^{\top})$$

6: for all 
$$t_z, t_x \in [T]$$
 do

7: **if** 
$$\neg \max[t_x, t_z]$$
 **then**  $S[t_x, t_z] \leftarrow -\infty$ 

8: **return** 
$$ilde{m{V}} = \operatorname{softmax_{row}}(m{S}) \, m{V}$$

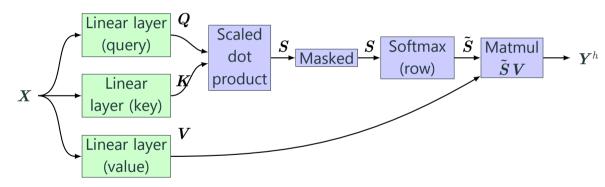

$$ho$$
 Query  $\in \mathbb{R}^{\ell_{\mathsf{X}} \times d_{\mathsf{attn}}}$ 

$$riangleright \mathsf{Key} \in \mathbb{R}^{\ell_{\mathsf{X}} imes d_{\mathsf{attn}}}$$

$$riangleright Value \in \mathbb{R}^{\ell_{\mathsf{X}} imes d_{\mathsf{out}}}$$

$$\triangleright \mbox{ Scaled score} \in \mathbb{R}^{\ell_{x} \times \ell_{x}}$$

#### Single masked self-attention head (GPT)

### **Left-to-right masked self-attention**

$$ilde{m{V}} = \operatorname{softmax}_{\mathsf{row}}(m{S}) \, m{V}$$

The output  $\tilde{V}[1:t,:]$  only depends on X[1:t,:], so it can be used to "predict" X[t+1,:]

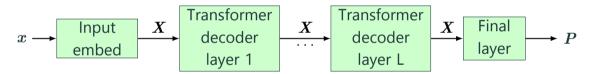

### **GPT** (decoding-only transformer, forward pass)

- 1: **function** DTRANSFORMER(x:  $\mathcal{W}$ )

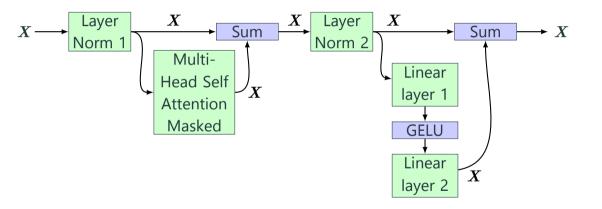

Input: —  $x \in V^*$ , a sequence of token IDs.  $\mathcal{W}$  — all trainable parameters

Output:  $P \in (0,1)^{\ell_x \times N_V}$ , where each row of P is a distribution over the vocabulary conditioned on previous tokens  $\hat{P}(x[t+1]|x[1:t])$ 

#### **Transformer decoder (GPT)**

#### **GPT** (decoding-only transformer, transformer layer)

### **GPT** (decoding-only transformer, forward pass)

- 1: **function** DTRANSFORMER( $x; \mathcal{W}$ )  $\ell \leftarrow \mathsf{length}(\boldsymbol{x})$ for  $t \in [\ell] : \boldsymbol{e}_t \leftarrow \boldsymbol{W}_{\boldsymbol{e}}[x[t],:] + \boldsymbol{W}_{\boldsymbol{p}}[t,:]$  ▶ Token emb. + positional emb. 3:  $X \leftarrow \mathsf{Stack}\ \mathsf{row\text{-}wise}[e_1, e_2, \dots e_\ell]$ 4: for l = 1, 2, ..., L do 5:  $X \leftarrow \mathsf{LayerNormPerRow}(X|\gamma_{t}^{1},\beta_{t}^{1})$ Normalization first 6:  $X \leftarrow X + \mathsf{MHATTENTIONMASK}(X|\mathcal{W}_I)$ 7:  $X \leftarrow \mathsf{LayerNormPerRow}(X|\gamma_1^2,\beta_1^2)$ 8:  $m{X} \leftarrow m{X} + \left(\mathsf{GELU}(m{X}m{W}_l^{\mathsf{mlp1}} +_{(\mathsf{row})} m{b}_l^{\mathsf{mlp1}}) m{W}_l^{\mathsf{mlp2}} +_{(\mathsf{row})} m{b}_l^{\mathsf{mlp2}}
  ight)$ 9:
- $X \leftarrow \text{LayerNormPerRow}(X|\gamma_l, \beta_l)$ 10:
- return  $P = \operatorname{softmax}(XW_u)$ 11:

▷ Project to vocab., probabilities

#### **GPT** (decoding-only transformer, forward pass)

Differences from BERT forward-pass:

Switched the ordering of layer normalization (line 6 and 8)

No final layer projection

Attention with left-to-right masking (line 7)

## **Training**

#### Training

Decoder model prompting Evolution of GPT

### **Decoder-Transfomer: Training on next token prediction**

```
1: function DTRAINING(\{x_n\}_{n=1}^{N_{\text{data}}} seqs, \theta init. params, N_{\text{epochs}}, \eta)
           for i \in [N_{\text{epochs}}] do
                   for n \in [N_{\text{data}}] do
3:
                          \ell \leftarrow \mathsf{lenath}(\boldsymbol{x}_n)
4:
                          P_{\theta} \leftarrow \mathsf{DTransformer}(x_n | \theta)
5:
                          loss_{\theta} \leftarrow -\sum_{t=1}^{\ell-1} log P_{\theta}[t, x_n[t+1]]
6:
                          \theta \leftarrow \theta - \eta \cdot \nabla \mathsf{loss}_{\theta}
7:
            return \theta
8:
```

### **Explaining line 6 (negative log likelihood)**

$$\left( \begin{array}{cccc} \mathsf{The} & \mathsf{cat} & \mathsf{sat} \right) \to \pmb{x}_n = \left( 21 & 11987 & 5438 \right) \\ \pmb{P}_{\pmb{\theta}} \leftarrow \mathsf{DTransformer}(\pmb{x}_n | \pmb{\theta}) \\ \pmb{P}_{\pmb{\theta}} = \left( \begin{array}{ccccc} 0.001 & 0.0007 & \dots & 0.0003 \\ 0.0013 & 0.0065 & \dots & 0.0001 \\ 0.079 & 0.015 & \dots & 0.0001 \end{array} \right)$$

$$(0.079 \quad 0.015 \quad \dots \quad 0.0001)$$

 $P_{\theta} \in (0,1)^{\ell_{x} \times N_{V}}$ , where each row of P is a distribution over the vocabulary

### Explaining line 6 (negative log likelihood), t=1

$$x_n = (21, 11987, 5438)$$

$$P_{\theta} = \begin{pmatrix} 0.001 & \dots & 0.0041_{11987} & \dots 0.0003 \\ \vdots & & & \end{pmatrix}$$

For t=1, the model should learn to predict "cat" (idx 11987)

Gold: 
$$y = (0, 0, \dots, 1_{11987}, \dots, 0) \in \mathbb{R}^{N_V}$$

Pred: 
$$\hat{\boldsymbol{y}} = \boldsymbol{P}_{\boldsymbol{\theta}}[1,:] = (0.001, \dots, 0.0041_{11987}, \dots 0.0003) \in \mathbb{R}^{N_{V}}$$

#### Categorical cross entropy loss (Lec. 4)

$$L(\hat{\mathbf{y}}, \mathbf{y}) := -\sum_{k=1}^{K} \mathbf{y}_{[k]} \log (\hat{\mathbf{y}}_{[k]})$$

$$= -1 \cdot \log(\hat{\mathbf{y}}[11987]) = -\log(\mathbf{P}_{\boldsymbol{\theta}}[1, 11987])$$

$$= -\log(\mathbf{P}_{\boldsymbol{\theta}}[1, \mathbf{x}_n[1+1]]) = -\log(\mathbf{P}_{\boldsymbol{\theta}}[t, \mathbf{x}_n[t+1]])$$

## **Decoder model prompting**

Training

Decoder model prompting

Evolution of GPT

#### **Decoding**

Input:  $x \in V^*$ , a prompt (sequence of token IDs)

Output:  $y \in V^*$ , continuation

```
1: function DINFERENCE(x, \theta, \ell_{\mathsf{qen}}, 	au)
          \ell \leftarrow \mathsf{lenath}(\boldsymbol{x})
            for i \in [\ell_{\mathsf{gen}}] do
3:
                   P \leftarrow \mathsf{DTransformer}(x|\theta)
4:
                   \boldsymbol{p} \leftarrow \boldsymbol{P}[\ell+i-1,:]
5:
                   sample token y from \mathbf{q} \propto \mathbf{p}^{(1/\tau)}
6:
                   \boldsymbol{x} \leftarrow [\boldsymbol{x}, y]
            return y = x[\ell + 1 : \ell + \ell_{gen}]
8:
```

#### **Evolution of GPT**

Training
Decoder model prompting

**Evolution of GPT** 

#### **Towards GPT-1**

Decoder part of the Transformer Encoder-Decoder model for MT (Vaswani, Shazeer, Parmar, Uszkoreit, Jones, Gomez, L. Kaiser, and Polosukhin, 2017)

Dropping encoder and using only decoder that consumes input and produces output trained as a standard language model for writing Wikipedia pages as summarization task (Liu, Saleh, Pot, Goodrich, Sepassi, Ł. Kaiser, and Shazeer, 2018)

A. Vaswani, N. Shazeer, N. Parmar, J. Uszkoreit, L. Jones, A. N. Gomez, L. Kaiser, and I. Polosukhin (2017). "Attention Is All You Need". In: Advances in Neural Information Processing Systems 30. Long Beach, CA, USA: Curran Associates, Inc., pp. 5998–6008
P. J. Liu, M. Saleh, E. Pot, B. Goodrich, R. Sepassi, Ł. Kaiser, and N. Shazeer (2018). "Generating Wikipedia by Summarizing Long Sequences". In: Proceedings of the 6th International Conference on Learning Representations. Vancouver, BC, Canada

#### **GPT-1**

GPT-1 (Radford, Narasimhan, Salimans, and Sutskever, 2018) adapted decoder only transformer

A. Radford, K. Narasimhan, T. Salimans, and I. Sutskever (2018). *Improving Language Understanding by Generative Pre-Training*. Technical report. OpenAI

- pre-training as LM
- fine-tuning with an extra final layer for the given task
- pre-trained on BooksCorpus (7k unique unpublished books)
- 12 decoder layers, 12 attention heads, 768 embedding size

"improving the state of the art on 9 of the 12 datasets we study"

#### GPT-2

#### Larger GPT-1

- pre-training as LM
- pre-trained on custom web scrape (all outbounds links from Reddit with at least 3 karma points, for quality reasons), 8 million documents total
- 48 decoder layers, 1600 embedding size (1.542 billion params)

Representing inputs, prompting, etc. — next lectures

A. Radford, J. Wu, R. Child, D. Luan, D. Amodei, and I. Sutskever (2019). *Language Models are Unsupervised Multitask Learners*. Technical report. OpenAl
